

Tilt Brackets for Rack Mount Monitors

Made in U.S.A

The RDMB series of brackets for rack mount monitors allow the monitor to be tilted away from the rack approximately 30 degrees. This tilt allows monitors with limited viewing angles to be mounted higher in the rack while retaining visibility (screen does not turn black when looking up at the moitor). The brackets can also be mounted in the reverse direction to tilt the monitor up for applications when the monitor is mounted low in the rack.

The vertical rack space required for mounting the bracket is 4U (7.0"). The bracket moves the monitor out 3.0" from the rack mount rails to allow for the tilt angle. Brackets are available for mounting 4u through 8U monitors.

Simply mount the brackets to the rack rails then mount the monitor to the bracket. Adjust for agnle then tighten adjustment screws. All rack rail and monitor attachment hole spacing is EIA standard.

Model Numbers (sold in Pairs):
RDMB-4U01 for 4U Monitors
